

Canada "Top 6" Banking Institution

Business Need

To improve IT's internal "customer" experience with a reliable, low-cost and low maintenance database solution, as well as reducing the time needed to deploy a resilient database environment through infrastructure as code.

Software

Crunchy Data High Availability Postgres with Ansible Automation platform, with over 100 current deployments and hundreds more planned in the near future.

Solution

The Crunchy Data HA Postgres with Ansible Automation platform includes a set of Ansible roles that automate the deployment of resilient database environments. It supports flexible deployment architectures, along with automated failover, back ups, recovery, and monitoring. The platform offers an open source and either On Prem or Cloud-agnostic non-lock in deployment strategy.

Benefits

Significant decrease in database provisioning time, along with gaining the ability to automate, standardize and deploy the environments through infrastructure as code. Gained high availability through self-healing and automated failover. Centralized monitoring of the health and performance of the environments. Their legacy and expensive RDBMS platforms required an estimated 3 days to deploy highly resilient environments. Now, using the Crunchy Data HA Postgres platform, that time has been reduced to roughly 30 minutes. Moving forward, this will allow an increasing scale of the Postgres deployments without requiring a corresponding increase of human resources. All with the backing of a Postgres Support vendor, 24 x 7 x 365 coverage, and access to the Crunchy Data Development team for on-going feature enhancements.

Industry:

Canadian Bank offering Personal and Commercial Banking, and Financial Services.

Deployment Country:

Canada

Overview

Founded more than 150 years ago, in the 1800's, this Crunchy Data customer offers personal and commercial banking and financial services.
